

## Supporting Information

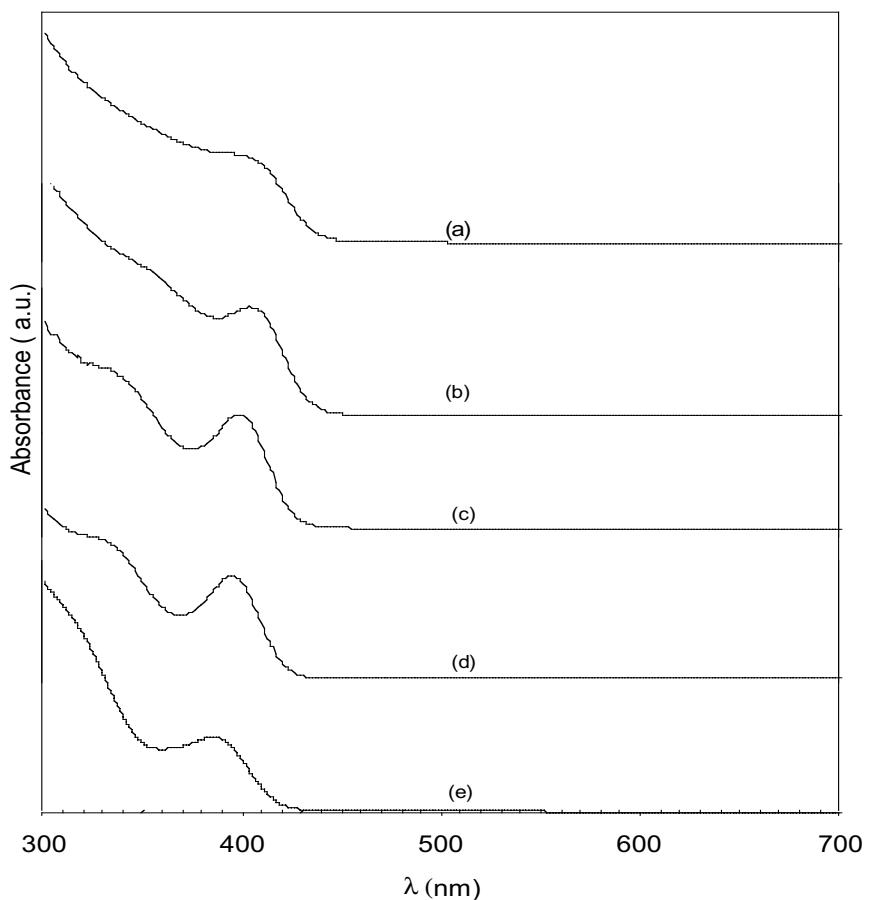

Figure S1 Comparison of the absorption spectra for Q-CdS in DMF pre (a) and post (b-e) size selection: (a) “as prepared” particles and (b)-(e) size selected fractions (1-IV). As expected the absorption peak is blue-shifted as particle size decreases from (a)-(e).

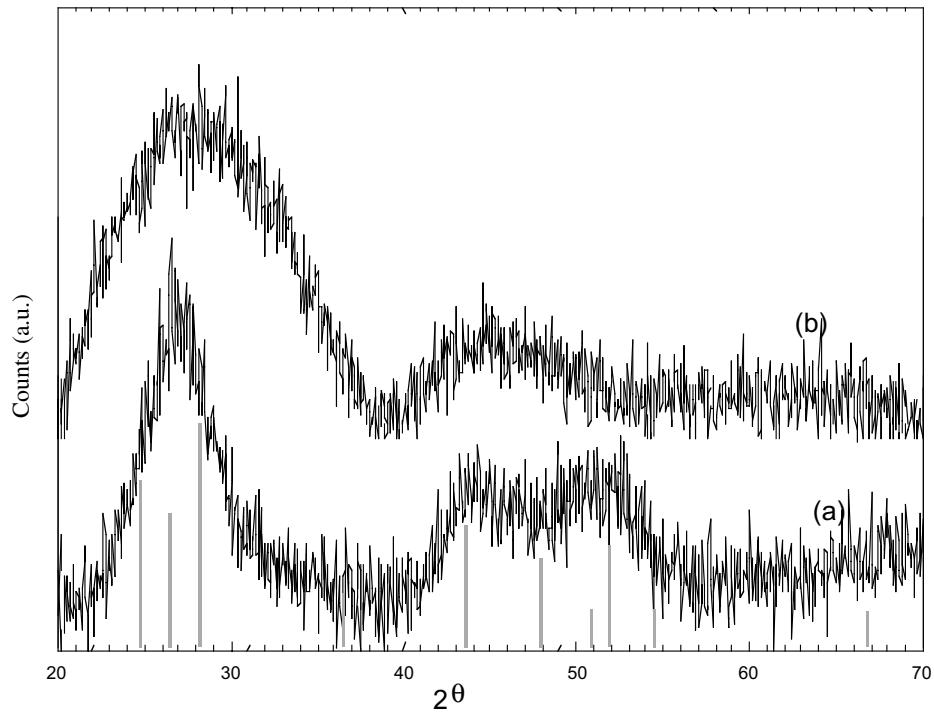

Figure S2 Comparison of the X-ray diffractograms recorded for (a) “as prepared” and (b) size selected fraction IV. Diffractograms fitted well to that predicted for a hexagonal structure and the vertical bars indicate the  $2\theta$  values calculated from JCPDS file 06-0314.

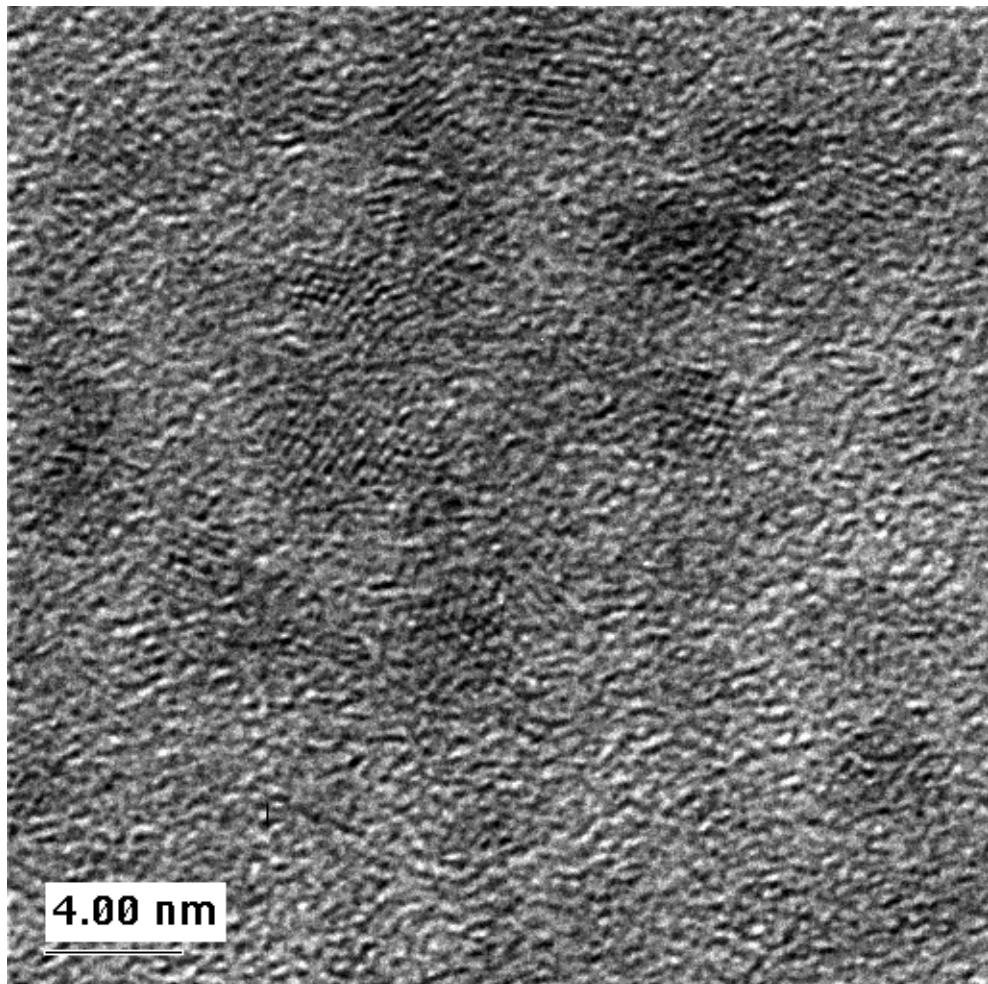

Figure S3 TEM image of fraction **IV**. A DMF solution containing the particles was drop-cast onto a 50 nm carbon film and dried in air overnight before imaging with Jeol 2010 (LaB<sub>6</sub>) at 200 keV. This image was recorded at a slight underfocus using a 512X512 pixel CCD camera.
